Sprint II

Design Objectives

For this sprint, our implementation aims are:

- Be able to deploy troops on a players turn
- Attack implementation with dice
- A total of 4 territories
- 2 players
- 5 troops per territory
- Territories can be conquered by another player (colour of node will change to opponent player)
- Player 1 is no longer the default winner (extension from sprint I)
- Territories display their name
- Country selected with mouse

UI Design

There are a variety of node connections that can be chosen when creating the map – this was one of a variety that I thought would be good for this sprint, but there is also:

Map #1: Nodes have a connection 1 or 2 – it is a simpler implementation and it allows

Map #2: Nodes have a connection of 1, 2 or 3 – This graph layout has a lobsided design where it is not symmetrical - which gives an advantage or disadvantage to players depending on what territories they hold

Map #3: All nodes have a connection of 3 – this is the most even graph layout – each node has the same number of connections so the difference between one territory or another is virtually negligible.

Map #4: All nodes have a connection of 2 – this has the same uniformity as map #3 but it has the added advantage of being a lot simpler in implementations.

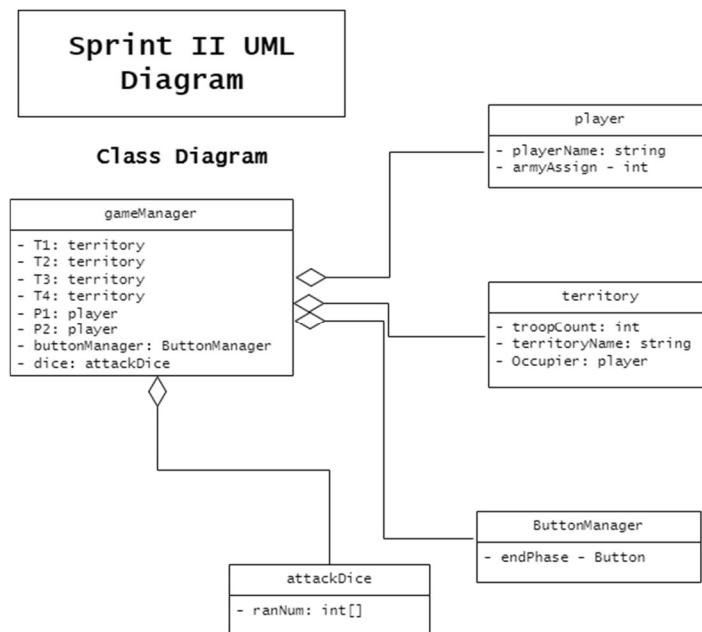

Class table

| Class No. | Class Name | Attributes | Comments |
|-----------|---------------|--|---|
| 1 | player | <ul style="list-style-type: none"> playerName: string armyAssign - int | Player class, contains the player information as in Sprint I |
| 2 | territory | <ul style="list-style-type: none"> troopCount: int territoryName: string Occupier: player | Territories are able to be occupied by different players depending on the outcome of player attacks |
| 3 | ButtonManager | <ul style="list-style-type: none"> End_phase: Button | The Button should only end the phases that the player is in (such as in the event a player wants to end their attack phase prematurely) |
| 4 | GameManager | <ul style="list-style-type: none"> T1: territory T2: territory T3: territory | The GameManager holds all the game object information as it is an |

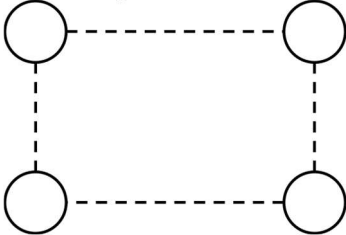

| | | | |
|---|------------|--|--|
| | | <ul style="list-style-type: none"> • T4: territory • P1: player • P2 player • buttonManager: ButtonManager • dice: attackDice | implementation of the classes above |
| 5 | attackDice | <ul style="list-style-type: none"> • ranNum: int[] | The Dice class should determine if the player has won or lose a battle by return the outcome of random numbers generated |

UML Diagrams

Design Changes

This is a section dedicated to a log of most of the major or notable design changes from the base design that are import to include:

| Type | Design | Implementations |
|-----------|--|--|
| Map | Has a variety of graph layouts and connections for the developers to choose from. | Used map #4 in the implementation  |
| Player | <ul style="list-style-type: none"> • playerName: string • armyAssign - int | <ul style="list-style-type: none"> • playerName • troopsToDeploy • ownedTerritories: List<Territory> • playerColour: Color32 |
| Territory | <ul style="list-style-type: none"> • troopCount: int • terrirotyName: string • Occupier: player | <ul style="list-style-type: none"> • territoryOwner • troopCount • territoryName • neighbours: List<Territory> |

| | | |
|---------------|---|--|
| | | <ul style="list-style-type: none"> territoryColour: Color32 |
| Button | <ul style="list-style-type: none"> End_phase: Button | <ul style="list-style-type: none"> continueButton (as apposed to a end phase button) confirmButton: Button |
| Dice | <ul style="list-style-type: none"> ranNum: int[] | <ul style="list-style-type: none"> |
| GameManager | <ul style="list-style-type: none"> T1: territory T2: territory T3: territory T4: territory P1: player P2 player buttonManager: ButtonManager dice: attackDice | <ul style="list-style-type: none"> buttonManager gameDice allTerritories: List<Territory> currentPlayers: List<Player> slider: Slider previousSelectedTerritory: Territory PlayerColours: List<Color32> |
| SliderManager | No Design | <ul style="list-style-type: none"> slider: Slider |

Conclusion

This splints design process improved from the first sprint by having a methodology of a first design and an evaluation of the design changes as the sprint continues. This helps for when accounting for aspects of the design that may seem straightforward but then are found out to be completely different than intended. This allowed a certain level of flexibility while still understanding the overall aims of the sprint and what was to be achieved by it.
